

Founder Signal — Master Product Specification

Version 1.0 • August 2026

Combined business, product, architecture, optimization and design specification.

Executive Product Definition

Founder Signal is a daily public opportunity radar. Research runs once per day; users browse published ideas. Raw source content is transient. Permanent storage contains compact signal aggregates, trends, competition metadata and top opportunity narratives.

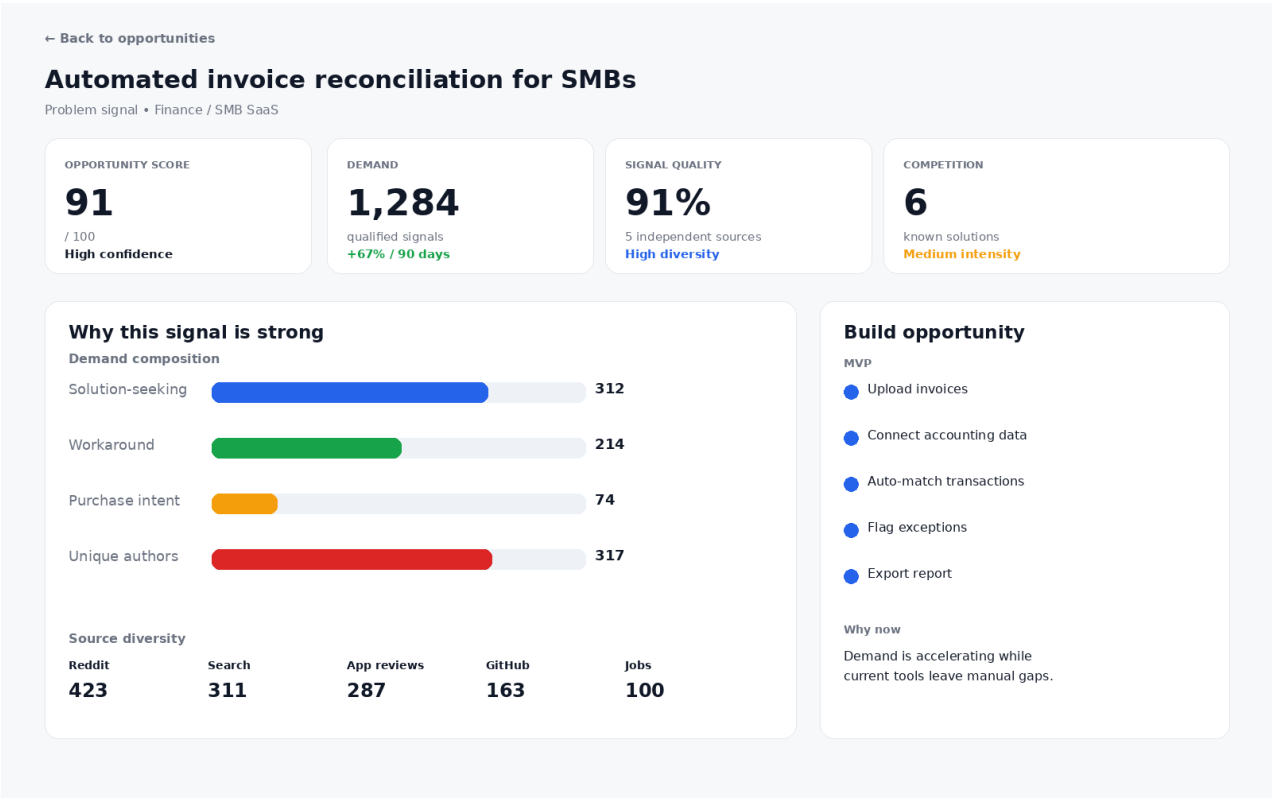

MVP Architecture

- 3–4 source families.
- Daily batch ingestion.
- 90–180 day active signal window.
- Transient raw data; no permanent post database.
- Rules/statistics-first processing.
- No vector DB required.
- Top 10–20 opportunities receive limited LLM enrichment.
- Public home, explore, opportunity detail and trends pages.

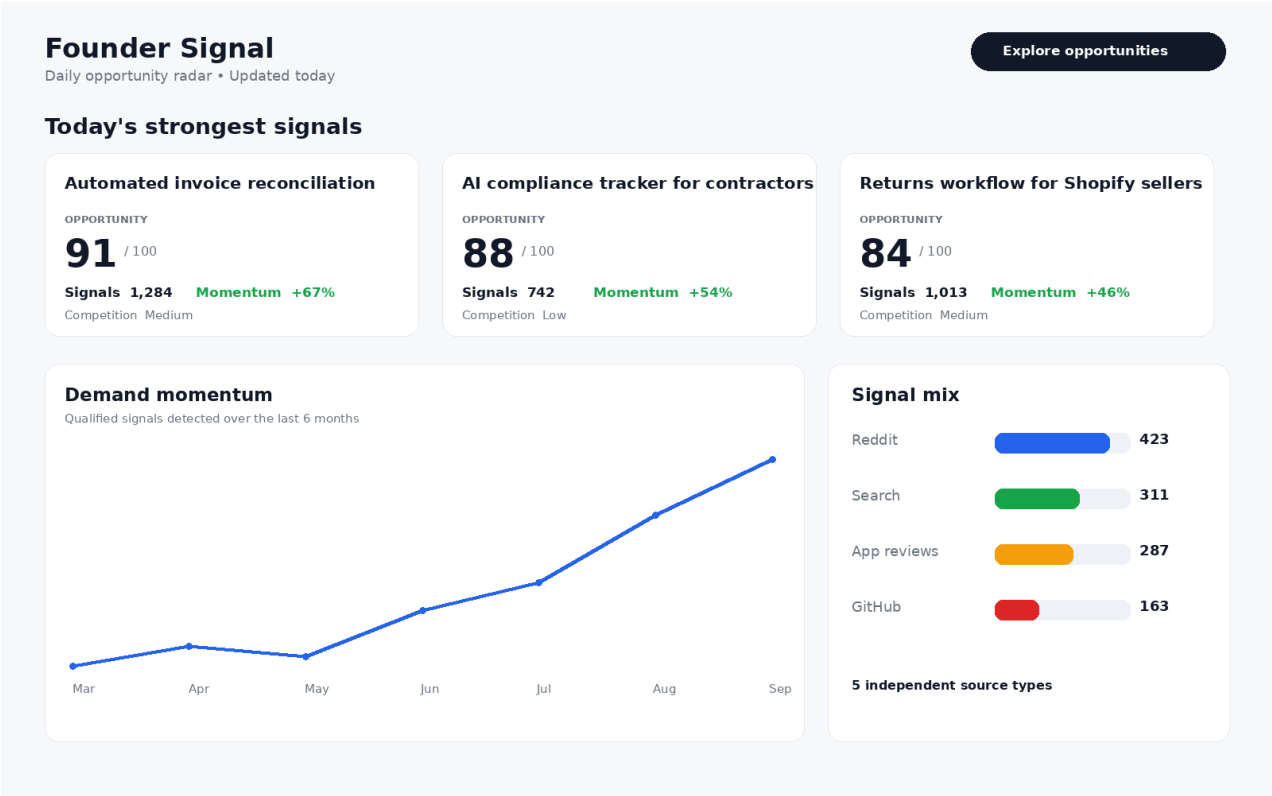

Cost Optimization

- Pre-filter before AI.
- Deduplicate before embeddings/LLM.
- Use problem fingerprints and deterministic classification.
- Aggregate counts rather than store posts.
- Reward source diversity over raw volume.
- Stop research when evidence is sufficient.
- Batch and cache LLM calls.
- AI only for naming, synthesis, MVP and risk.
- Run daily, not continuously.
- One PostgreSQL database and one small application stack.

Opportunity momentum map

Roadmap

Phase	Focus
MVP	Daily signals + ranked opportunity cards
Phase 2	More sources + semantic clustering + competitor intelligence
Phase 3	Deep validation + personalization + alerts
Phase 4	Opportunity graph + predictive insights + founder copilot
